GENERATE A CARTESIAN PRODUCT OF TWO OR MORE TABLES

10. If the REGIONS table, which contains 4 rows, is cross joined to the COUNTRIES table, which contains 25 rows, how many rows appear in the final results set? (Choose the best answer.)

- A. 100 rows
- B. 4 rows
- C. 25 rows
- D. None of the above

Activity 2:

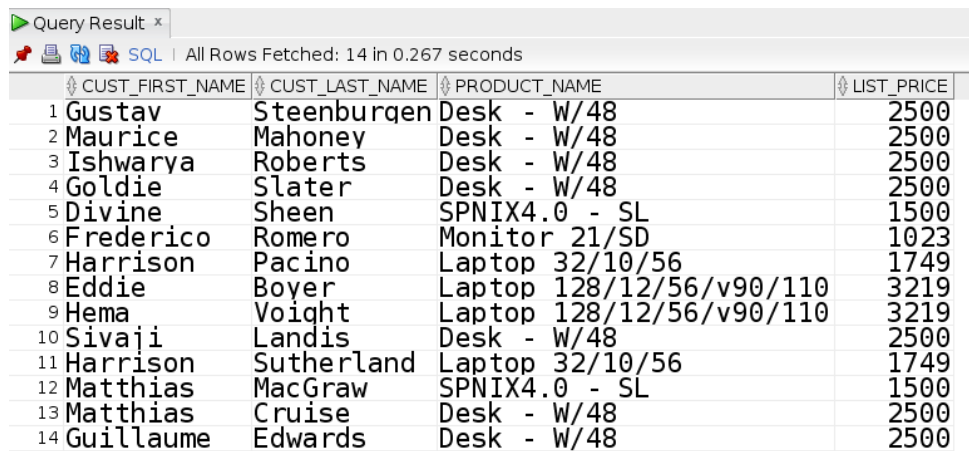

Propose an answer to the following issues:

- You are required to retrieve information from multiple tables, group the results, and apply an aggregate function to them. Can a group function be used against data from multiple table sources?
- When joining two tables, there is a risk that between them they contain common column names. Does Oracle know which tables to fetch data from if such columns are present in the SELECT list?
- The NATURAL JOIN clause is used to join rows from two tables based on columns with common names sharing identical values. Is it possible to join two tables based on some of the shared columns and not all of them?
- The data in two tables you wish to join is related but does not share any identically named columns. Is it possible to join tables using columns that do not share the same name?
- You wish to divide staff into four groups named after the four regions in the REGIONS table. Is it possible to obtain a list of EMPLOYEE_ID, LAST_NAME, and REGION_NAME values for each employee by joining the EMPLOYEE_ID and REGION_ID columns in a round-robin manner?
- You are required to retrieve a list of DEPARTMENT_NAME and LAST_NAME values for all departments, including those that currently have no employees assigned to them. In such cases the string 'No Employees' should be displayed as the LAST_NAME column value. Can this be done using joins?

Activity 3:

Connect to the OE schema and complete the following tasks.

You are required to produce a report of customers who purchased products with list prices of more than \$1000. The report must contain customer first and last names and the product names and their list prices. Customer information is stored in the CUSTOMERS table, which has the CUSTOMER_ID column as its primary key. The product name and list price details are stored in the PRODUCT_INFORMATION table with the PRODUCT_ID column as its primary key. Two other related tables may assist in generating the required report: the ORDERS table, which stores the CUSTOMER_ID and ORDER_ID information, and the ORDER_ITEMS table, which stores the PRODUCT_ID values associated with each ORDER_ID. There are several approaches to solving this question.

Activity 4:

This exercise must be performed in the HR schema.

- a) The JOB_HISTORY table shares three identically named columns with the EMPLOYEES table: EMPLOYEE_ID, JOB_ID, and DEPARTMENT_ID. You are required to describe the tables and fetch the EMPLOYEE_ID, JOB_ID, DEPARTMENT_ID, LAST_NAME, HIRE_DATE, and END_DATE values for all rows retrieved using a pure natural join. Alias the EMPLOYEES table as EMP and the JOB_HISTORY table as JH and use dot notation where possible.

	EMPLOYEE_ID	JOB_ID	DEPARTMENT_ID	LAST_NAME	HIRE_DATE	END_DATE
1	176	SA	REP	80 Taylor	24-MAR-06	31-DEC-06

- b) Each record in the DEPARTMENTS table has a MANAGER_ID column matching an EMPLOYEE_ID value in the EMPLOYEES table. You are required to produce a report with one column aliased as Managers. Each row must contain a sentence of the format FIRST_NAME LAST_NAME is manager of the DEPARTMENT_NAME department. Alias the EMPLOYEES table as E and the DEPARTMENTS table as D and use dot notation where possible.

Query Result x

SQL | All Rows Fetched: 11 in 0.032 seconds

Managers
1 Steven King is manager of the Executive department.
2 Alexander Hunold is manager of the IT department.
3 Nancy Greenberg is manager of the Finance department.
4 Den Raphaely is manager of the Purchasing department.
5 Adam Fripp is manager of the Shipping department.
6 John Russell is manager of the Sales department.
7 Jennifer Whalen is manager of the Administration department.
8 Michael Hartstein is manager of the Marketing department.
9 Susan Mavris is manager of the Human Resources department.
10 Hermann Baer is manager of the Public Relations department.
11 Shelley Higgins is manager of the Accounting department.

- c) There is a hierarchical relationship between employees and their managers. For each row in the EMPLOYEES table the MANAGER_ID column stores the EMPLOYEE_ID of every employee's manager. Using a self-join on the EMPLOYEES table, you are required to retrieve the employee's LAST_NAME, EMPLOYEE_ID, manager's LAST_NAME, and employee's DEPARTMENT_ID for the rows with DEPARTMENT_ID values of 10, 20, or 30. Alias the EMPLOYEES table as E and the second instance of the EMPLOYEES table as M. Sort the results based on the DEPARTMENT_ID column.

- d) Write a query for the HR department to produce the addresses of all the departments. Use the LOCATIONS and COUNTRIES tables. Show the location ID, street address, city, state or province, and country in the output. Use a NATURAL JOIN to produce the results.

Activity 5:

This practice is intended to give you experience in extracting data from more than one table using the SQL:1999-compliant joins.

1. Write a query for the HR department to produce the addresses of all the departments. Use the LOCATIONS and COUNTRIES tables. Show the location ID, street address, city, state or province, and country in the output. Use a NATURAL JOIN to produce the results.

6. Create a report for the HR department that displays employee last names, department numbers, and all the employees who work in the same department as a given employee. Give each column an appropriate label. Save the script to a file named `lab_12_06.sql`.

	 DEPARTMENT	 EMPLOYEE	 COLLEAGUE

7. The HR department needs a report on job grades and salaries. To familiarize yourself with the `JOB_GRADES` table, first show the structure of the `JOB_GRADES` table. Then create a query that displays the name, job, department name, salary, and grade for all employees.

DESC JOB_GRADES		
Name	Null	Type

GRADE_LEVEL		VARCHAR2(3)
LOWEST_SAL		NUMBER
HIGHEST_SAL		NUMBER
3 rows selected

8. The HR department wants to determine the names of all the employees who were hired after Davies. Create a query to display the name and hire date of any employee hired after employee Davies.

	 LAST_NAME	HIRE_DATE

2	Mourgos	16-NOV-99
3	Matos	15-MAR-98

6	Taylor	24-MAR-98
7	Grant	24-MAY-99
8	Fay	17-AUG-97

9. The HR department needs to find the names and hire dates of all the employees who were hired before their managers, along with their managers' names and hire dates. Save the script to a file named lab_12_09.sql.

	 LAST_NAME	HIRE_DATE	 LAST_NAME_1	HIRE_DATE_1
